

For the final project, I decided to design a personal website to show my personal interests. There are three pages in total: the home page, which provided links to separate pages, a page for dance, and a page for travel. On the home page, I created a sidebar for linking to different pages, and include a few icons on the top to make it prettier. Hover effect is adopted as pseudo selectors on the home page. The first selection, which is “traditional medicine lover,” linked to a Youtube video about my family’s history in Traditional Chinese Medicine practice. By helping make this documentary, I wanted to preserve my family’s medical cultural heritage which has been passed on for generations, but also spread Traditional Chinese Medicine culture by collaborating with AIESEC Global Volunteer Project. The texts in the second page with video links show my passion in different styles of dances. Since the choreography themed on snowing, I include snowflakes animation effects. On the traveller page, I used javascript to make pop-up lightbox for my travel pictures. They can pop up when you click on them, and hide the effect when clicking outside the pop-up. In all the pages, css features include spacing, font, color, and flexboxes are used to improve the website’s hierarchy, achieving visual aesthetics, increasing User Experience(UX), and conducting information efficiently.
